

Failing Copper Pipes

Living in Fear of a pinhole leak was not an option for this Newport Beach, Big Canyon Golf Course Family

The YD-D9® System gives this homeowner peace of mind.

This home is everything you could ever ask for and located on one of the most prestigious golf courses in the country, just a short distance from the beautiful harbor in Newport Beach.

The Problem

One of the overwhelming concerns facing this family was the fear of the damage that could result from another slab leak. After experiencing several leaks in the past, they were seeking a permanent solution to their failing copper water piping system. Repiping was not a viable alternative. The quality and architectural design of the home made repiping this property a non-option for this homeowner. Having heard about ACE DuraFlo's process on TV, this homeowner & family wanted to protect their pipes from further deterioration. By choosing ACE DuraFlo as a preventative measure, this homeowner can live with confidence that there will be no more leaks occurring and has avoided a future disaster!

The Solution

ACE DuraFlo's system of in-place pipe restoration.

Once ACE DuraFlo was contracted to perform its service, the homeowner started to breathe easier. On the day of their choice they scheduled the ACE DuraFlo Team to come in and perform the restoration. ACE DuraFlo epoxy lining was installed inside the existing piping without the need to open up walls, ceiling, or floors. Two days later, the restoration project was complete and they now live with the confidence that pinhole leaks are part of their past and are not going to be part of their future.

ACE DuraFlo® epoxy lining materials are listed by NSF® (National Sanitation Foundation) for immediate return to service and are UPC® listed products
